## SUPERIOR MAINTENANCE - SURFACE DEGREASING

### THE CHALLENGE

With environmental regulations and maintenance budgets tightening, operating professionals are taking ownership and seeking new ways to improve the use and life of their refining equipment. Preventive maintenance is taking on an ever increasing roll in total equipment operation. Surface cleanliness is an important element of a PM program as it improves visual inspection, simplifies routine maintenance, and extends equipment life.

Consequently, many requests from refinery professionals have lead to the introduction of a new industrial degreaser. PetroBlast is the only degreasing agent in the refining industry that offers you a high Kauri-Butanol value and RTI's patented technology. This technology allows you to spray the concentrated degreasing chemistry of PetroBlast on the heaviest hydrocarbons. In addition, it is compatible with all metallurgies.

### THE SOLUTION

The advantage of this technology is that the powerful chemistry of PetroBlast soaks into hydrocarbon contaminants and works harder and longer for you.

You simply spray it on, allow it to dissolve heavy contaminant, then rinse off the contaminant.

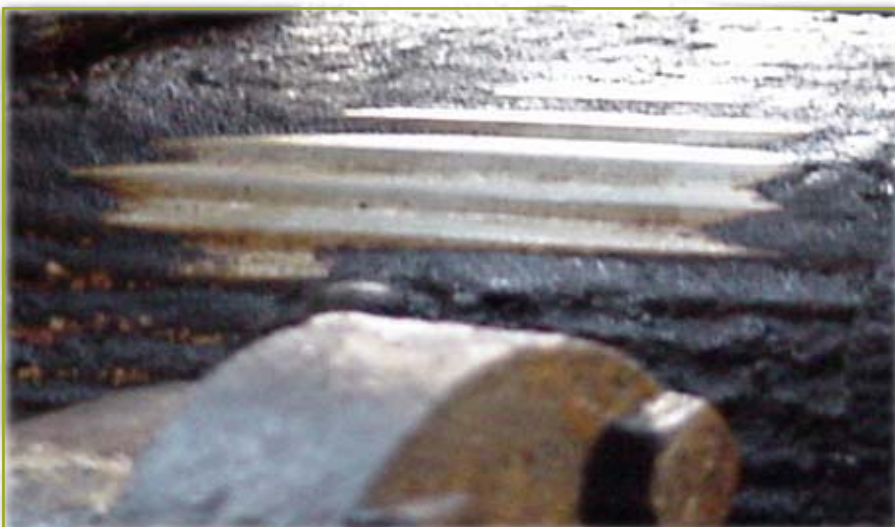

PetroBlast does the work so you

can spend much less time cleaning and more time improving the performance of your equipment! PetroBlast dissolves the toughest contaminants on valves, tools, piping, concrete, pumps and pump bases. PetroBlast is easy to apply and is bio-degradable, contains no chelating agents or phosphates, and is easily rinsed away with water.

### THE PETROBLAST ADVANTAGE

Refineries are using Refined Technologies' products and services to gain a strategic advantage in the marketplace.

In your daily operations meetings, we encourage you to consider Strategic Chemistry: the timely use of chemistry and planning, engineered to improve operating margins.
